

Does your protection match your exposure?

The more 'internet-active' you are... the more threats you face...
the more comprehensive the protection you need.

Businesses like yours are using more of what the internet has to offer to compete with your slower-moving rivals. This tide of activity is generating new cyber threats every day – it's way beyond viruses now.

Upgrading to full internet security gives you the protection you need and, if you act now, will also mean you can give every employee covered by your license a FREE* Full Home Edition of the same software. Everyone wins.

Internet security vs anti-virus... what's the difference?

The new generation of cybercriminal targets small business web traffic in ever-smarter ways, constantly changing the location and 'signature' of the threat to avoid detection. With tens of thousands of new viruses appearing every day, signature detection alone simply can't keep up.

AVG Internet Security goes beyond signature-based detection and adds innovative, 'investigative' technologies – behavioural analysis, in-the-cloud testing and application Whitelisting – to counter "here today, gone tomorrow" threats. The result is a real-time, dynamic defense system that liberates small businesses to take full advantage of all the internet has to offer.

With AVG Internet Security all these threats are covered

AVG Internet Security Business Edition – all the protection provided by AVG Anti-Virus plus...

Data Protection module – Safe online business transactions.

Enhanced Anti-Spam module – Prevents phishers, scammers and spammers from clogging workstations.

Anti-Spam Server Protection module – Protects phishers, scammers and spammers from clogging mail servers.

And much more... including of course the unique AVG LinkScanner® web protection technology, blocking access to poisoned web pages.

Choose AVG Internet Security – Business Edition

It's the solution for all those who need peace of mind and want it from software that's engineered to be lighter on resources, faster in operation and a complete single answer.

Are you 'internet-active' or 'internet-passive'?

Match your protection to your risk profile.

'Passive'

You only use PCs in a limited way – internal data and systems, surfing the internet and sending emails.

AVG Anti-Virus is probably all you need.

'Active'

- You complete online transactions with suppliers or customers involving sensitive data.
- You store personally-identifiable information about customers or employees.
- You exchange sensitive business information over email and instant messaging.

Anti-virus alone may mean you are exposed. You need full AVG Internet Security.

Upgrade to AVG Internet Security Business Edition during May or June 2010 and take advantage of this fantastic offer.
